Special Character Gizmo

The Special Character Gizmo is a free, fast and easy way to protect yourself from hidden special characters

Do you routinely paste text from documents and websites?
Does Microsoft Office add strange characters into your text?

Never worry about accidentally pasting hidden characters again.

A special character is a symbol that is not a letter, a number or punctuation and may not be visible. There are many ways in which special characters can be cut and pasted into your text. If you cut and paste directly from a webpage or from a Microsoft Office document you may encounter special characters. Microsoft Word in particular will substitute and insert single quotes, copyright symbols, tabs and even smiley faces. *Note:* Special characters are sometimes called white-space or escape characters.

The Special Character Gizmo will help you identify and remove these characters. Just paste the suspect text into the Gizmo. The Gizmo will then highlight each special character for you and calculate a total number of special characters.

Just click Gizmo to the right. It's instant and easy. No software to install.

The new and improved Gizmo will check your spelling.

The Gizmo is free software. You can save and keep this document. You can also email it to a friend.
